

Your recording, finished beautifully.

A private, in-browser studio that turns a family piece of music — a flute recording, a tribute, a festival song — into a finished, shareable video. No account, no upload, no editing skills.

THE GAP

Families already make personal music. Finishing it is the hard part.

THE MAKERS

People record a flute piece, a birthday song or a tribute for a family occasion, often in their own studio software. The audio is done. It then sits as a file on a phone.

THE MISSING STEP

A shareable version needs a picture, the words, a look, some motion. Video editors are heavy; AI song tools make **generic songs**, not a finished keepsake of this piece.

WHAT WE SAW

On one creator's channel (28 days to 28 Sep 2026), personal and occasion songs held viewers best: viewers aged **45–54 watched ~46%** on average (a Bhojpuri haldi song reached 56%), while famous-song covers brought reach but not attention.

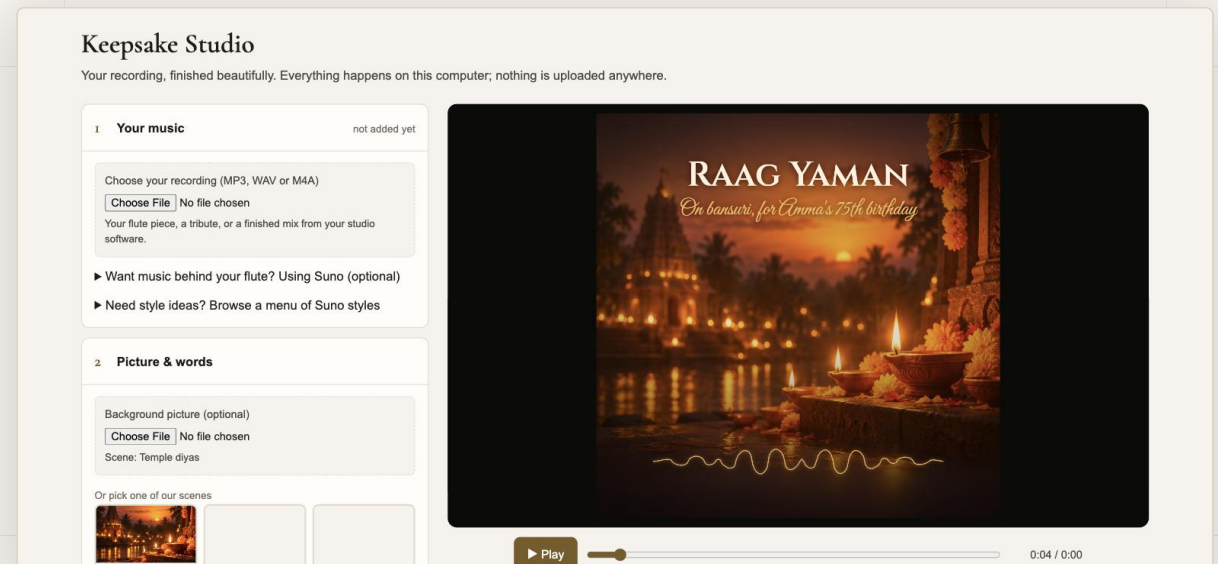

One small channel: directional, not proof. Reason enough to test with real makers.

Keepsake Studio · public overview · © 2026 Sauravi Rai

Five steps, one page, all on your computer.

- **Add your recording** (MP3, WAV, M4A).
- **Pick a picture:** your own photo, a curated scene, or one made with ChatGPT.
- **Choose a look,** add title, dedication and timed lyrics.
- **Add your portrait badge** and a moving waveform.
- **Make my video:** an MP4 in tall, wide or square, plus a ready YouTube title, description and tags.

Nothing is uploaded. No account. No tracking. Every control has a plain-language "i" tip.

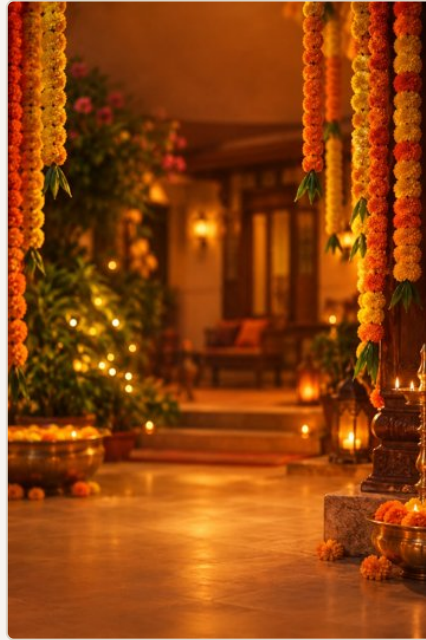

THE TASTE LAYER

The technology is common. The look and feel is the product.

Four looks — **Heirloom gold**, **Monsoon night**, **Temple dusk**, **Classic portrait** — each with its own lettering, colour and grain, plus a curated scene library rooted in Indian settings and the retro, nostalgic mood people already respond to.

HOW IT IS BUILT

Deliberately small: one static page, no backend.

RUNS IN THE BROWSER

Rendering happens on the maker's own machine (canvas plus the browser's recorder). Nothing to host except a page, so the running cost is close to zero.

PRIVATE BY DESIGN

Music, photos and dedications never leave the computer. That matters for unpublished or deeply personal recordings, and it removes accounts and data storage.

GUARDED IP

Proprietary and all rights reserved. Invited testers use it freely and keep ownership of their recordings and videos.

Accessibility: built to WCAG 2.2 AA (keyboard, screen-reader labels, contrast). **Trade-off:** it is a desktop-first, one-piece-at-a-time tool by design; any sharing across people would need a backend.

WHERE IT GOES NEXT

Coming soon

YOUTUBE PUBLISHING

PLANNED

Today: a Publish helper writes the title, description and tags to copy, and opens YouTube's upload page. It sends nothing.

Next: one-click upload from the studio. It needs Google sign-in and review, so it is a longer road.

DEEPER SUNO INTEGRATION

PLANNED

Today: a guide and style lines to copy into Suno by hand.

Next: pick a style here and have it sent to Suno for you. Depends on Suno's developer programme; we applied on 29 Sep 2026, no answer yet.

ARTWORK DIRECTOR

PLANNED

Today: a ChatGPT helper that copies a short brief, plus curated scenes.

Next: an agent that reads the piece's title, mood and look, drafts the artwork brief and picks or creates the scene.

MORE LOOKS AND SCENES

PLANNED

Regional and festival collections; looks matched to instruments and occasions.

EASIER LYRIC TIMING

IDEA

Today lyrics take optional [1:05] time marks; smarter alignment would cut the manual work.

Direction, not commitments: what is built first depends on where testers get stuck.

THE FIRST TEST

One real maker, doing everything himself.

WHO

A family musician who plays the flute, builds his own tracks in studio software and makes tributes for family occasions. Free, invited, self-serve: no hand-holding from us.

WHAT WE WANT TO LEARN

- Can he go from file to finished video **unaided**?
- Where does he stop, hesitate or ask?
- Does he share the result, and where?
- Would he make a **second** one?

Approach: send the link, watch what happens, revise. A working MP4 and five scenes are live today; his feedback decides what comes next.
